[illegible]

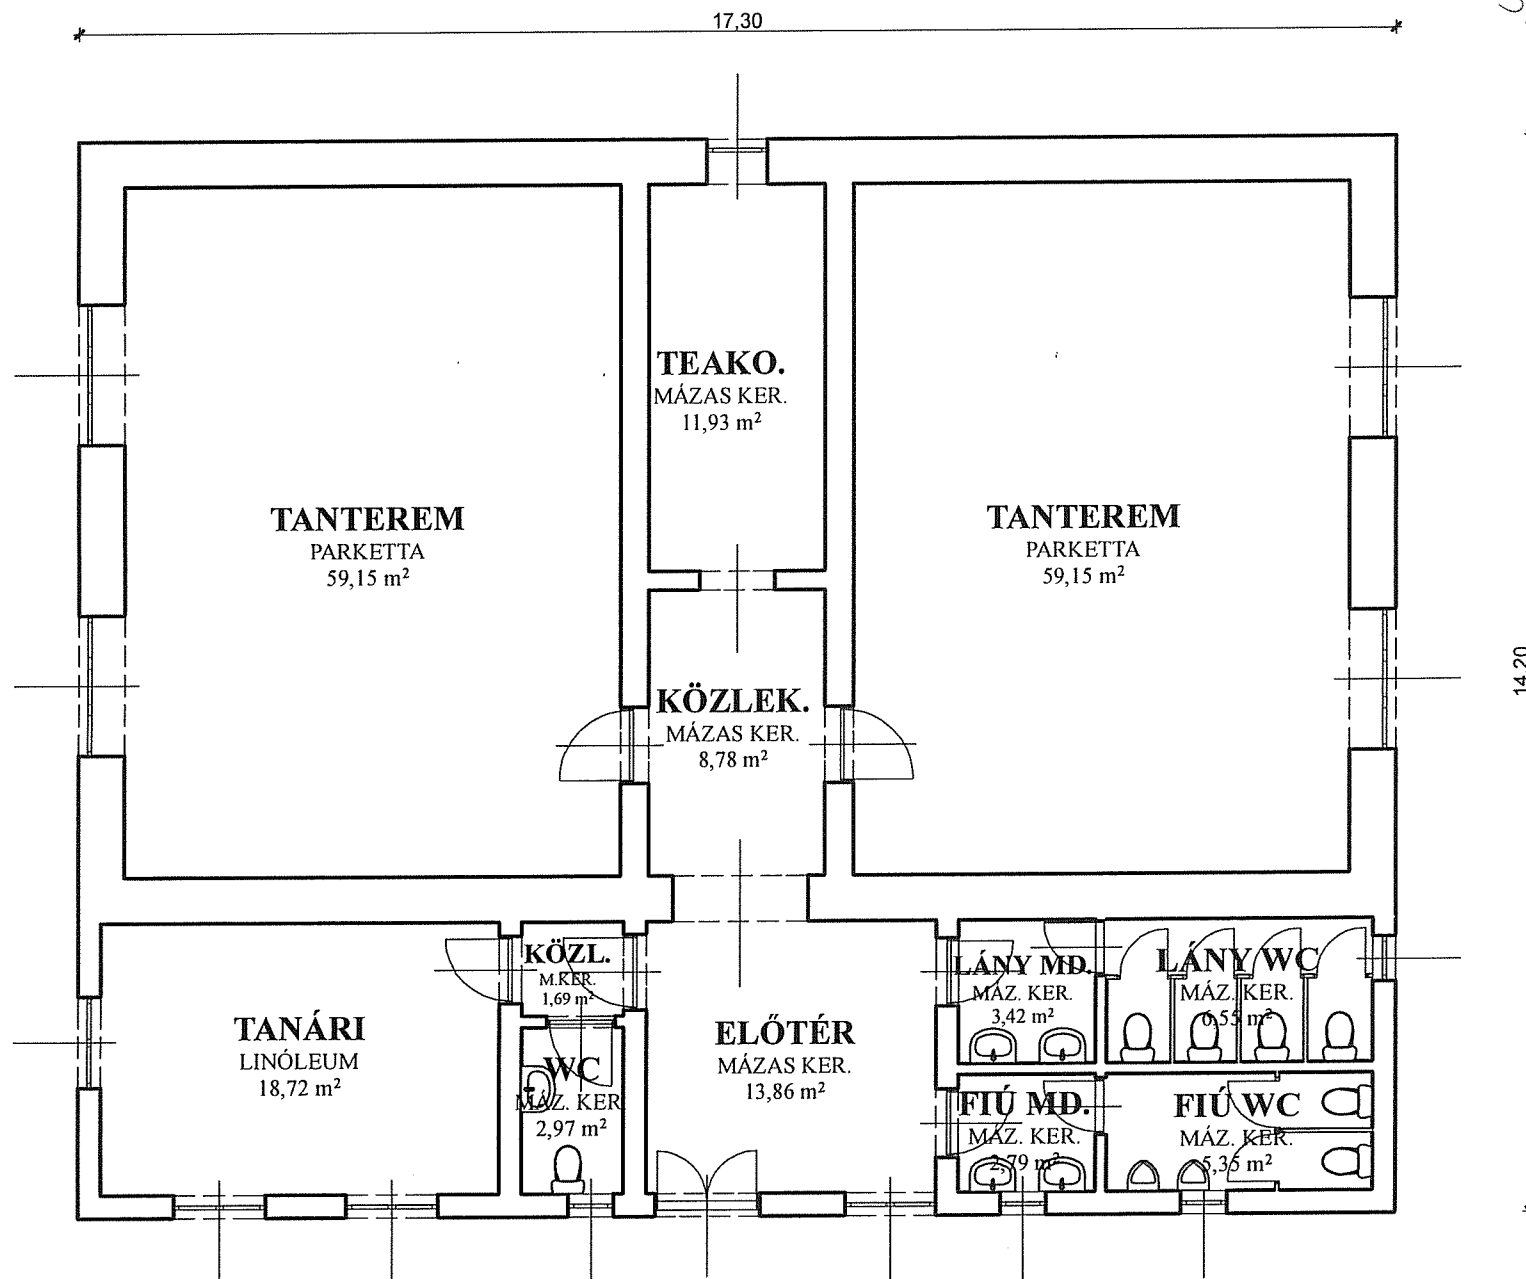

Poly(alkene)s as precursors of poly(arylene)s via electrophilic aromatic substitution

Case no.	Case description	Case no.	Case description
1	Case 1: A patient with a history of chronic renal failure, who was treated with dialysis. The patient was found to have a large, well-circumscribed, solid, tan-colored mass in the right kidney. The mass was 10 cm in diameter and contained a large area of hemorrhage. The patient died of renal failure.	2	Case 2: A patient with a history of chronic renal failure, who was treated with dialysis. The patient was found to have a large, well-circumscribed, solid, tan-colored mass in the right kidney. The mass was 10 cm in diameter and contained a large area of hemorrhage. The patient died of renal failure.
3	Case 3: A patient with a history of chronic renal failure, who was treated with dialysis. The patient was found to have a large, well-circumscribed, solid, tan-colored mass in the right kidney. The mass was 10 cm in diameter and contained a large area of hemorrhage. The patient died of renal failure.	4	Case 4: A patient with a history of chronic renal failure, who was treated with dialysis. The patient was found to have a large, well-circumscribed, solid, tan-colored mass in the right kidney. The mass was 10 cm in diameter and contained a large area of hemorrhage. The patient died of renal failure.
5	Case 5: A patient with a history of chronic renal failure, who was treated with dialysis. The patient was found to have a large, well-circumscribed, solid, tan-colored mass in the right kidney. The mass was 10 cm in diameter and contained a large area of hemorrhage. The patient died of renal failure.	6	Case 6: A patient with a history of chronic renal failure, who was treated with dialysis. The patient was found to have a large, well-circumscribed, solid, tan-colored mass in the right kidney. The mass was 10 cm in diameter and contained a large area of hemorrhage. The patient died of renal failure.
7	Case 7: A patient with a history of chronic renal failure, who was treated with dialysis. The patient was found to have a large, well-circumscribed, solid, tan-colored mass in the right kidney. The mass was 10 cm in diameter and contained a large area of hemorrhage. The patient died of renal failure.	8	Case 8: A patient with a history of chronic renal failure, who was treated with dialysis. The patient was found to have a large, well-circumscribed, solid, tan-colored mass in the right kidney. The mass was 10 cm in diameter and contained a large area of hemorrhage. The patient died of renal failure.
9	Case 9: A patient with a history of chronic renal failure, who was treated with dialysis. The patient was found to have a large, well-circumscribed, solid, tan-colored mass in the right kidney. The mass was 10 cm in diameter and contained a large area of hemorrhage. The patient died of renal failure.	10	Case 10: A patient with a history of chronic renal failure, who was treated with dialysis. The patient was found to have a large, well-circumscribed, solid, tan-colored mass in the right kidney. The mass was 10 cm in diameter and contained a large area of hemorrhage. The patient died of renal failure.
